

OSI Data Link Layer

Network Fundamentals – Chapter 7

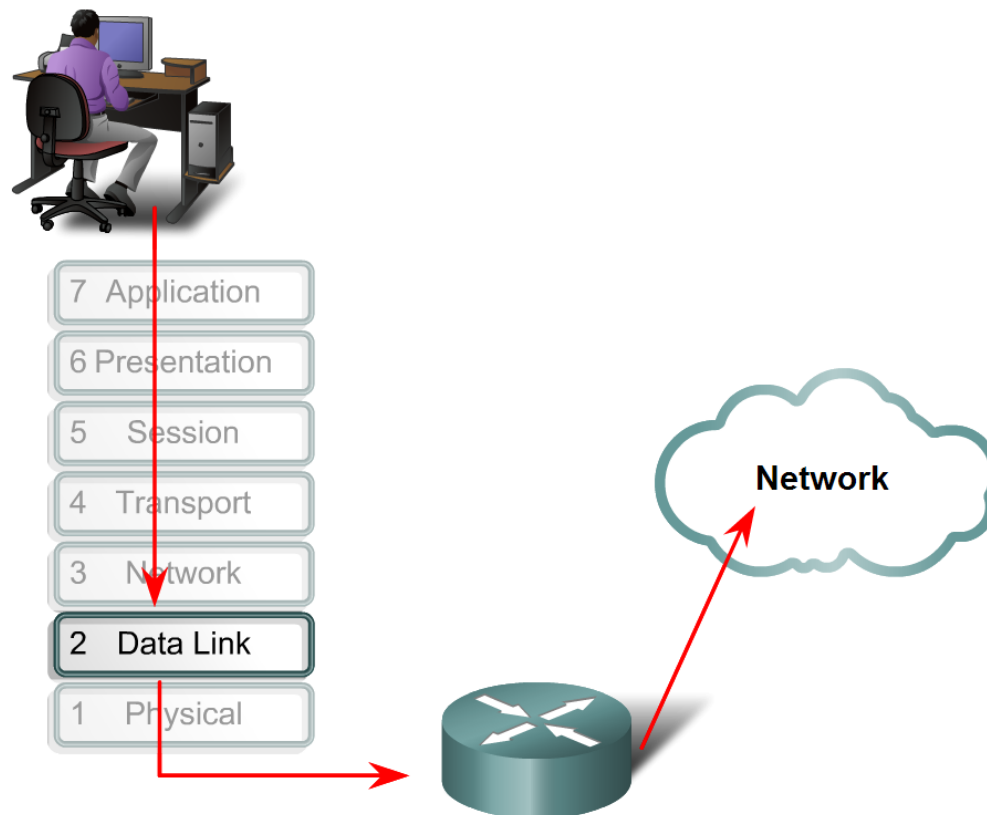

Cisco | Networking Academy®
Mind Wide Open™

Objectives

- Explain the role of Data Link layer protocols in data transmission.
- Describe how the Data Link layer prepares data for transmission on network media.
- Describe the different types of media access control methods.
- Identify several common logical network topologies and describe how the logical topology determines the media access control method for that network.
- Explain the purpose of encapsulating packets into frames to facilitate media access.
- Describe the Layer 2 frame structure and identify generic fields.
- Explain the role of key frame header and trailer fields including addressing, QoS, type of protocol and Frame Check Sequence.

Data Link Layer – Accessing the Media

- Describe the service the Data Link Layer provides as it prepares communication for transmission on specific media

The Data Link layer prepares network data for the physical network.

Data Link Layer – Accessing the Media

- Describe why Data Link layer protocols are required to control media access

The Data Link Layer

Data link layer protocols govern how to format a frame for use on different media.

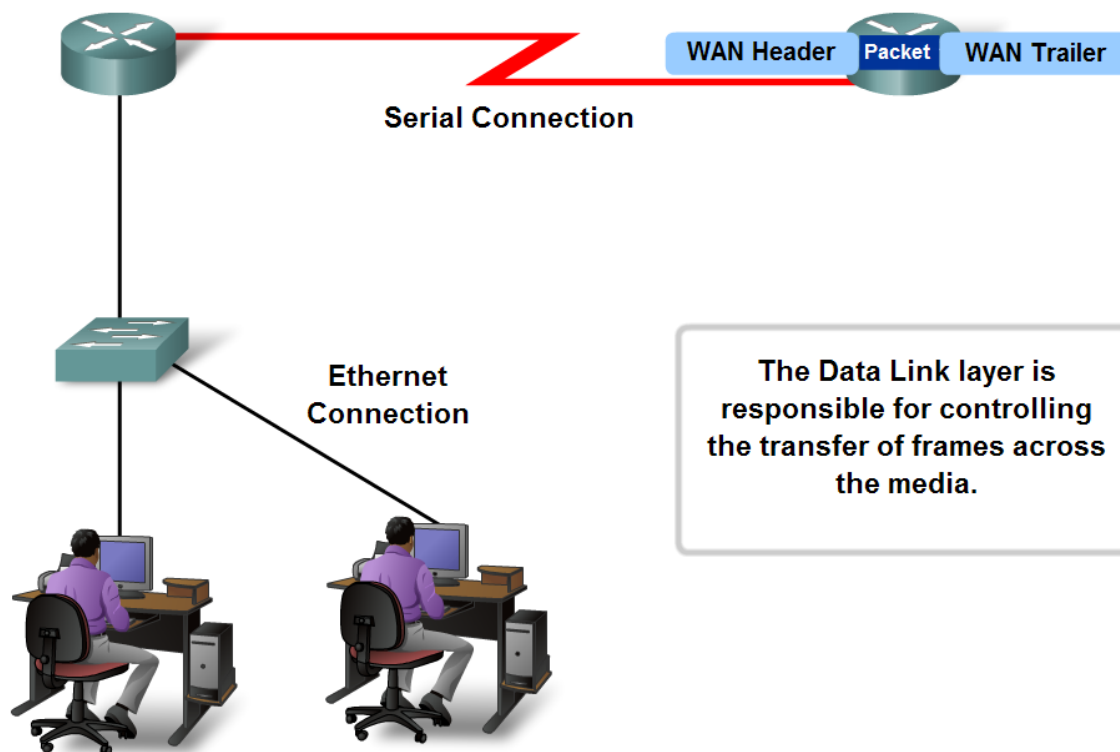

Different protocols may be in use for different media.

Data Link Layer – Accessing the Media

- Describe the role of framing in preparing a packet for transmission on a given media

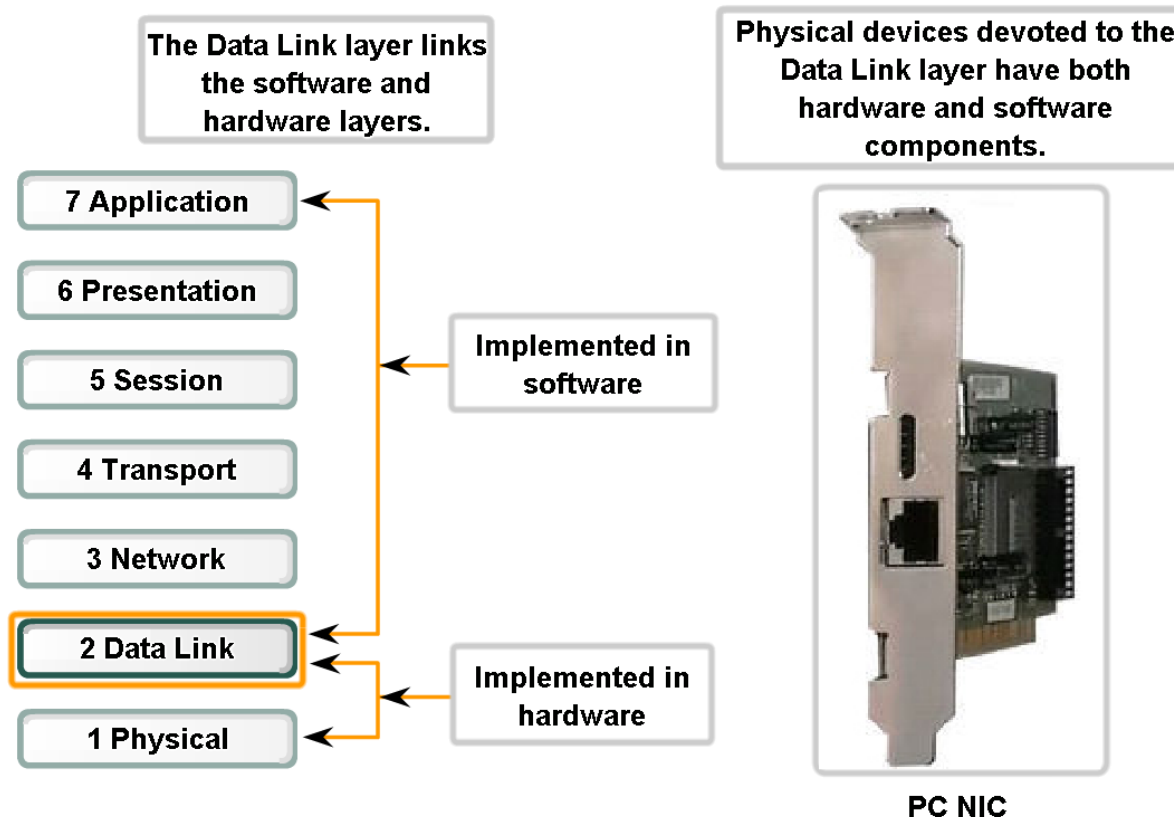

Transfer of Frames

Data Link Layer – Accessing the Media

- Describe the role the Data Link layer plays in linking the software and hardware layers

Connecting Upper Layer Services to the Media

Data Link Layer – Accessing the Media

- Identify several sources for the protocols and standards used by the Data Link layer

Standards for the Data Link Layer

ISO:	HDLC (High Level Data Link Control)
IEEE:	802.2 (LLC), 802.3 (Ethernet) 802.5 (Token Ring) 802.11(Wireless LAN)
ITU:	Q.922 (Frame Relay Standard) Q.921 (ISDN Data Link Standard) HDLC (High Level Data Link Control)
ANSI:	3T9.5 ADCCP (Advanced Data Communications Control Protocol)

Media Access Control Techniques

- Explain the necessity for controlling access to the media

Media Access Control Methods

No control at all would result in many collisions. Collisions cause corrupted frames that must be resent.

Methods that enforce a high degree of control prevent collisions, but the process has high overhead.

Take turns

Methods that enforce a low degree of control have low overhead, but there are more frequent collisions.

Media Access Control Techniques

- Identify two media access control methods for shared media and the basic characteristics of each

Media Access Control for Shared Media

Controlled Access

Method	Characteristics	Example
Controlled Access	<ul style="list-style-type: none"> Only one station transmits at a time Devices wishing to transmit must wait their turn No collisions Some deterministic networks use token passing 	<ul style="list-style-type: none"> Token Ring FDDI

Media Access Control for Shared Media

Contention-Based Access

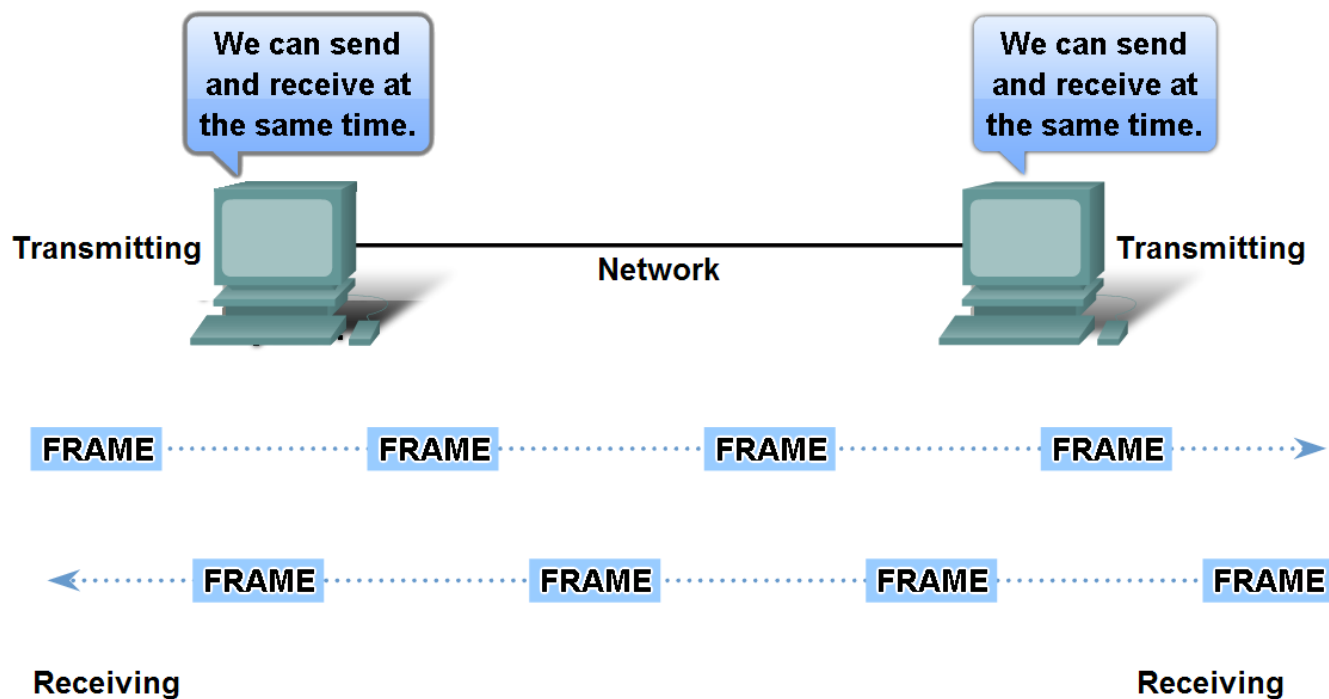

Method	Characteristics	Example
Contention Based Access	<ul style="list-style-type: none"> Stations can transmit at any time Collisions exist Mechanisms exist to resolve contention: <ul style="list-style-type: none"> CSMA/CD for Ethernet networks CSMA/CA for 802.11 wireless networks 	<ul style="list-style-type: none"> Ethernet Wireless

Media Access Control Techniques

- Define Full Duplex and Half Duplex as it relates to Media Access Control for non-shared media

Media Access Control for Non-shared media

Media Access Control Techniques

- Describe the purpose of a logical topology and identify several common logical topologies

Media Access Control Techniques

- Contrast logical and physical topologies

Logical Point-to-Point Topology

Media Access Control Techniques

- Identify the characteristics of point-to-point topology and describe the implications for media access when using this topology

Point-to-Point Topology

Media Access Control Techniques

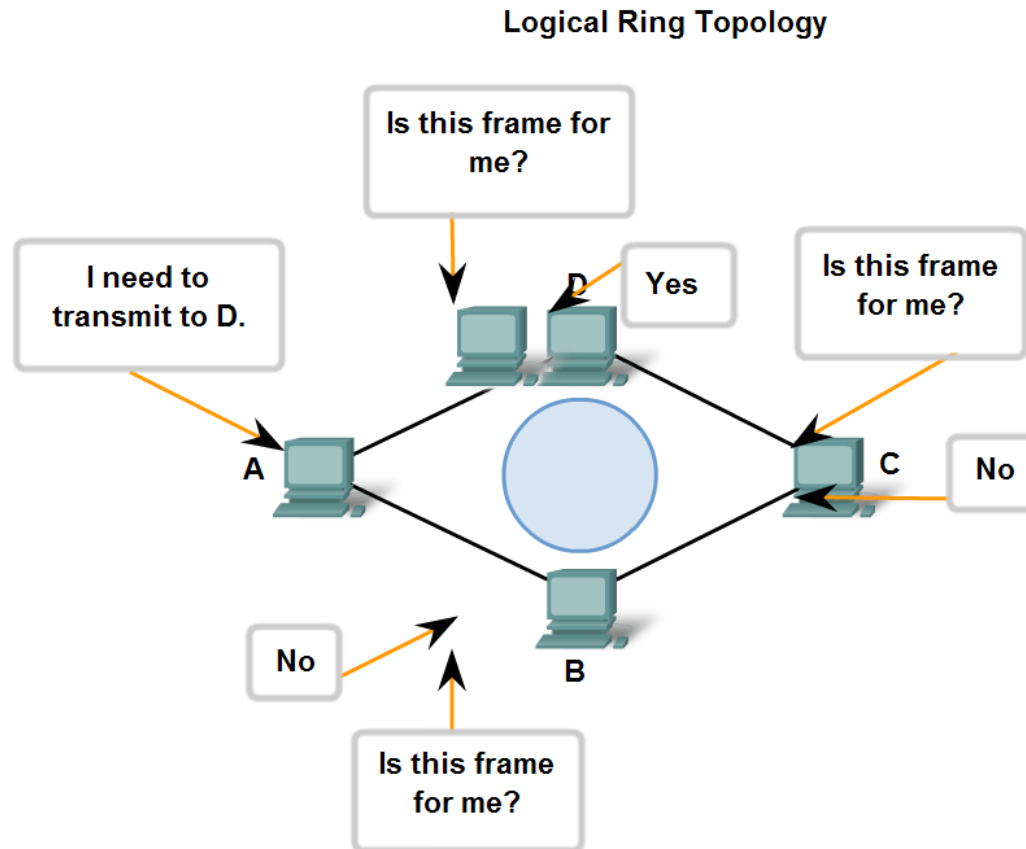

- Identify the characteristics of multi-access topology and describe the implications for media access when using this topology

Logical Multi-Access Topology

Media Access Control Techniques

- Identify the characteristics of ring topology and describe the implications for media access when using this topology

Media Access Control Addressing and Framing Data

- Describe the purpose of encapsulating packets into frames to facilitate the entry and exit of data on media

Data Link Layer Protocols - The Frame

In a fragile environment, more controls are needed to ensure delivery. The header and trailer fields are larger as more control information is needed.

Greater effort needed to ensure delivery = higher overhead = slower transmission rates

In a protected environment, we can count on the frame arriving at its destination. Fewer controls are needed, resulting in smaller fields and smaller frames.

Less effort needed to ensure delivery = lower overhead = faster transmission rates

Media Access Control Addressing and Framing Data

- Describe the role of the frame header in the Data Link layer and identify the fields commonly found in protocols specifying the header structure

The Role of the Header

Media Access Control Addressing and Framing Data

- Describe the role of addressing in the Data Link layer and identify cases where addresses are needed and cases where addresses are not needed

Logical Multi-Access Topology

Logical Point-to-Point Topology

Media Access Control Addressing and Framing Data

- Describe the importance of the trailer in the Data Link layer and its implications for use on Ethernet, a "non-reliable" media

The Role of the Trailer

Summary

In this chapter, you learned to:

- Explain the role of Data Link layer protocols in data transmission.
- Describe how the Data Link layer prepares data for transmission on network media.
- Describe the different types of media access control methods.
- Identify several common logical network topologies and describe how the logical topology determines the media access control method for that network.
- Explain the purpose of encapsulating packets into frames to facilitate media access.
- Describe the Layer 2 frame structure and identify generic fields.
- Explain the role of key frame header and trailer fields, including addressing, QoS, type of protocol, and Frame Check Sequence.
